

Docket No. AUS920010056US1

**CLAIMS:**

What is claimed is:

1. A method in a data processing system for transferring data, the method comprising:
  - 5 receiving data describing objects;
  - storing the data in a database format in a database;
  - responsive to receiving a request for an object from a processing environment, retrieving data corresponding to the object from the database; and
  - 10 translating the data corresponding to the object into a form for use by the processing environment.
2. The method of claim 1, wherein the data is in a markup language data file.
3. The method of claim 1, wherein the database format  
15 is a set of entries in a table.
4. The method of claim 1, wherein the request originates from a data proxy.
5. The method of claim 1, wherein the processing environment is a Java processing environment and the form  
20 is a Java class.
6. A method in a data processing system for transferring data, the method comprising:
  - receiving a markup language file describing at least one object;
  - 25 converting the markup language file to at least one table in a database, wherein the at least one table

Docket No. AUS920010056US1

contains object parameters for the at least one object;  
responsive to a request for an object from a  
requestor, translating the at least one table into the  
object; and

5 sending the object to the requestor.

7. The method of claim 6, further comprising:

validating the markup language file using a document  
type definition file prior to the prior to converting the  
markup language file.

10 8. The method of claim 6, wherein the request for the  
object is for an object in a desired form selected among  
a plurality of available object forms and wherein the  
tranlating step translates the table into the desired  
object form.

15 9. The method of claim 6, wherein the object is a  
graphical user interface object used for representing a  
system resource in a graphical user interface.

10. A method in a data processing system for  
transferring data, the method comprising:

20 storing external customizable data for use by a  
software system during execution of processes by the  
software system in a central repository, wherein the  
software system is distributed within a network data  
processing system; and

25 delivering the external customizable data in a  
format usable by the software system in response to  
requests from the software system.

Docket No. AUS920010056US1

11. The method of claim 10, wherein the external customizable data is an extensible markup language data file.

12. The method of claim 10, wherein the object is an  
5 instance of a Java class.

13. The method of claim 10, wherein the requestor is a data proxy.

14. The method of claim 10, wherein the object is a Java class.

10 15. The method of claim 10, wherein the object is an instance of a Java object.

16. The method of claim 10, wherein the step of sending the object to the requestor comprises:

15       sending a universal resource identifier to the requestor.

17. The method of claim 10, wherein the external customizable data is a markup language file and further comprising:

      validating the markup language file.

20 18. The method of claim 17, wherein the markup language file is an extensible markup language file.

19. The method of claim 18, wherein the extensible markup language file is validated using a document type definition file.

Docket No. AUS920010056US1

20. A system for transferring data, the system comprising:

a database, wherein the database contains representations of objects;

5 a data import process, wherein the data import process receives an external data file describing an object, translates external data file into a representation, and stores the representation in the database; and

10 a data server process, wherein the data server process receives a request from a requestor, fetches a selected representation in response to receiving the request, translates the selected representation into an object, and sends the object to the requestor.

15 21. The system of claim 20 further comprising:

a set of data proxies, wherein a data proxy within the set of data proxies connects to the data server process, receives a request from a local processing environment, routes the request to the data server,

20 receives a result from the data server process, and sends the result to the local processing environment.

22. The system of claim 20, wherein the external data file is a markup language file.

23. The system of claim 20, wherein the markup language  
25 file is an extensible markup language file.

24. A data processing system comprising:

a bus system;

a communications unit connected to the bus, wherein

Docket No. AUS920010056US1

data is sent and received using the communications unit;

a memory connected to the bus system, wherein a set of instructions is located in the memory; and

a processor unit connected to the bus system,

- 5 wherein the processor unit executes the set of instructions to receive data describing objects; store the data in a database format in a database; retrieve data corresponding to the object from the database in response to receiving a request for an object from a  
10 processing environment; and translate the data corresponding to the object into a form for use by the processing environment.

25. The data processing system of claim 24, wherein the bus system includes a primary bus and a secondary bus.

- 15 26. The data processing system of claim 24, wherein the processor unit includes a single processor.

27. The data processing system of claim 24, wherein the processor unit includes a plurality of processors.

28. The data processing system claim 24, wherein the  
20 communications unit is an Ethernet adapter.

29. A data processing system comprising:

a bus system;

a communications unit connected to the bus, wherein data is sent and received using the communications unit;

- 25 a memory connected to the bus system, wherein a set of instructions is located in the memory; and

a processor unit connected to the bus system,

Docket No. AUS920010056US1

wherein the processor unit executes the set of instructions to receive a markup language file describing at least one object; convert the markup language file to at least one table in a database, wherein the at least  
5 one table contains object parameters for the at least one object; translating the at least one table into the object in response to a request for an object from a requestor; and send the object to the requestor.

30. The data processing system of claim 29, wherein the  
10 bus system includes a primary bus and a secondary bus.

31. The data processing system of claim 29, wherein the processor unit includes a single processor.

32. The data processing system of claim 29, wherein the processor unit includes a plurality of processors.

15 33. The data processing system claim 29, wherein the communications unit is an Ethernet adapter.

34. A data processing system comprising:  
a bus system;  
a communications unit connected to the bus, wherein  
20 data is sent and received using the communications unit;  
a memory connected to the bus system, wherein a set of instructions is located in the memory; and  
a processor unit connected to the bus system,  
wherein the processor unit executes the set of  
25 instructions to store external customizable data for use by a software system during execution of processes by the software system in a central repository, wherein the

Docket No. AUS920010056US1

software system is distributed within a network data processing system; and deliver the external customizable data in a format usable by the software system in response to requests from the software system.

5 35. The data processing system of claim 34, wherein the bus system includes a primary bus and a secondary bus.

36. The data processing system of claim 34, wherein the processor unit includes a single processor.

10 37. The data processing system of claim 34, wherein the processor unit includes a plurality of processors.

38. The data processing system claim 34, wherein the communications unit is an Ethernet adapter.

39. A data processing system for transferring data, the data processing system comprising:

15 receiving means for receiving data describing objects;

storing means for storing the data in a database format in a database;

20 retrieving means, responsive to receiving a request for an object from a processing environment, for retrieving data corresponding to the object from the database; and

25 translating means for translating the data corresponding to the object into a form for use by the processing environment.

Docket No. AUS920010056US1

40. The data processing system of claim 39, wherein the data is in a markup language data file.

41. The data processing system of claim 39, wherein the database format is a set of entries in a table.

5 42. The data processing system of claim 39, wherein the request originates from a data proxy.

43. The data processing sysytem of claim 39, wherein the processing environment is a Java processing environment and the form is a Java class.

10 44. A data processing system for transferring data, the data processing system comprising:

receiving means for receiving a markup language file describing at least one object;

15 converting means for converting the markup language file to at least one table in a database, wherein the at least one table contains object parameters for the at least one object;

20 translating means, responsive to a request for an object from a requestor, for translating the at least one table into the object; and

sending means for sending the object to the requestor.

45. The data processing system of claim 44, further comprising:

25 validating means for validating the markup language file using a document type definition file prior to the prior to converting the markup language file.

Docket No. AUS920010056US1

46. The data processing system of claim 44, wherein the request for the object is for an object in a desired form selected among a plurality of available object forms and wherein the translating step translates the table into the  
5 desired object form.

47. The data processing system of claim 44, wherein the object is a graphical user interface object used for representing a system resource in a graphical user interface.

10 48. A data processing system for transferring data, the data processing system comprising:

storing means for storing external customizable data for use by a software system during execution of processes by the software system in a central repository,  
15 wherein the software system is distributed within a network data processing system; and

delivering means for delivering the external customizable data in a format usable by the software system in response to requests from the software system.

20

49. The data processing system of claim 48, wherein the external customizable data is an extensible markup language data file.

50. The data processing system of claim 48, wherein the  
25 object is an instance of a Java class.

51. The data processing system of claim 48, wherein the requestor is a data proxy.

Docket No. AUS920010056US1

52. The data processing system of claim 48, wherein the object is a Java class.

53. The data processing system of claim 48, wherein the sending means comprises:

- 5 means for sending a universal resource identifier to the requestor.

54. The data processing system of claim 48, wherein the external customizable data is a markup language file and further comprising:

- 10 validating means for validating the markup language file.

55. The data processing system of claim 54, wherein the markup language file is an extensible markup language file.

- 15 56. The data processing system of claim 55, wherein the extensible markup language file is validated using a document type definition file.

57. A computer program product in a computer readable medium for transferring data, the method comprising:

- 20 first instructions for receiving data describing objects;

second instructions for storing the data in a database format in a database;

- 25 third instructions, responsive to receiving a request for an object from a processing environment, for retrieving data corresponding to the object from the database; and

Docket No. AUS920010056US1

fourth instructions for translating the data corresponding to the object into a form for use by the processing environment.

58. A computer program product in a computer readable  
5 medium for transferring data, the computer program product comprising:

first instructions for receiving a markup language file describing at least one object;

10 second instructions for converting the markup language file to at least one table in a database, wherein the at least one table contains object parameters for the at least one object;

15 third instructions, responsive to a request for an object from a requestor, for translating the at least one table into the object; and

fourth instructions for sending the object to the requestor.

59. A computer program product in a computer readable  
20 medium for use in transferring data, the computer program product comprising:

25 first instructions for storing external customizable data for use by a software system during execution of processes by the software system in a central repository, wherein the software system is distributed within a network data processing system; and

second instructions for delivering the external customizable data in a format usable by the software system in response to requests from the software system.
